

## FACTSHEET

---

### Microchipping and registering your cat

#### What is microchipping?

A microchip is the size of a grain of rice and contains a unique numerical barcode which can be read with a scanner. The chip is implanted under the skin at the back of the cat's neck, between the neck and shoulder blades. It is no more painful than having an injection and doesn't require sedation. You are not likely to be able to feel the chip. The numbers on the barcode are entered into a confidential database, the NSW Pet Registry, along with the cat's details and the contact details of the owner.

#### A microchip is not a tracking device!

A microchip is not the same as a GPS or tracking device – it is simply a barcode, as you see on items in shops that are scanned at the cash register. It will not 'find' your cat if your cat is lost. If your cat is lost, and then found by someone and taken to a vet, shelter or pound, they can scan your cat for a microchip and then look up the microchip numbers in the Pet Registry to find your contact details. They can then contact you to let you know they have found your cat.

It is important to know that your information is kept confidential and only authorised people can access this information. It is also vitally important to keep your contact details up-to-date so that you can be reunited with your cat if they do become lost.

#### Why does your cat need a microchip?

If you care about your cat, you will make sure they are microchipped and registered so that they can always be reunited with you should they ever become lost. It is also the law in NSW that any cat born after 1999 must have a microchip. It is illegal to sell or give away a cat without a microchip.

Tragically, the majority of unidentified, unregistered cats do not leave pounds alive: they are neither reunited nor adopted but euthanased. Don't let your cat become a tragic statistic – make sure they are microchipped, registered, and that your contact details are always up-to-date.

#### How to register your cat in NSW

When your cat is microchipped, you will be asked to sign a form with all your contact details on it. A copy of this form will be given to you to keep. The authorised microchip implanter will keep a copy and enter the microchip number and your details into the NSW Pet Registry.

The NSW Pet Registry is an online confidential database of microchipped and registered cats and dogs which owners can access to add and modify their details.

If you have access to a computer or internet-enabled mobile device, you can complete the registration of your cat (including payment of the lifetime registration fee) by creating an owner profile and linking yourself to your cat's microchip number. You can log back in at any time to update your contact details, notify your cat as missing and even transfer ownership.

If you don't have online access or an email address, you can still register your cat, change and update details and notify your cat as missing by visiting your local council.

If you are adopting from Cat Protection, registration and payment of the lifetime registration fee will be completed with you at the time of adoption.

If your cat is desexed, you will receive a substantial discount on lifetime registration.

By law, cats must be registered by 4 months so we recommend you adopt a kitten who is already desexed – such as a kitten from Cat Protection – or you make sure to book your kitten in for desexing before they are 12 weeks of age.

You can still create a profile on the NSW Pet Registry if you already own microchipped and registered pets. We strongly recommend this as the easiest way to manage your contact details and giving you the best chance of being reunited with your pets should they ever become lost, injured or stolen.

### **Collars & tags**

You might wish to consider a collar and tag (with your phone number on it) if your cat goes outside. This gives a clear indication your cat is owned, but it is also a simple way for a member of the public to contact you should they find your cat. Remember, only authorised staff in places such as pounds, vet clinics and shelters can scan for microchips and access the Pet Registry. However, please bear in mind collars can be dangerous for cats so you might discuss this decision with your vet.

### **Tracking devices**

There are a number of new pet-tracking devices on the market and these work either via radio frequency (RF) or global positioning system (GPS). These devices attach to a collar and the device sends information to a handset, computer or smartphone. These devices have had some novelty value but we recommend discussing this with your vet if it is something you are interested in for your cat. We recommend keeping your cat safe by keeping them confined to your property where possible.

**We recommend keeping all your cat's paperwork in a special file so you can easily access information that is needed, as well as maintaining an up-to-date online profile on the NSW Pet Registry. These simple steps will be invaluable in case of emergency and will give your cat the best chance of being returned to you if they are ever lost, stolen or injured.**
